

Revised Weights and Measures Portfolio Now in Effect

Following a UK-wide review commissioned by CTSI Council and overseen by the Qualifications Panel, the Weights and Measures portfolio has been revised.

The updated portfolio - Version 3 - is now the current version.

The review updated the instrument list and supporting guidance to reflect current legislation, operational practice and technological developments across all four UK nations. The portfolio's objectives and the evidential tasks required to demonstrate competence are unchanged, so the standard expected of candidates and the way competence is assessed remain the same.

The main changes are an increase in the overall requirement from 20 to 21 pieces of equipment (19 mandatory plus a minimum of 2 optional), working standard fuel measures becoming a mandatory instrument, and some clarified terminology. Full details, including the complete instrument list and a summary of changes, are set out in the accompanying FAQs and instrumentation documents.

Transition arrangements: candidates beginning their portfolio now should use Version 3. Candidates who have started and are already in progress using Version 2, may continue and submit at any submission deadline up to and including 1 October 2027; from that deadline, only Version 3 will be accepted.

We request that candidates do not swap to Version 3 if they have already started on the previous version. Verifiers will not accept transfers to Version 3 if already working through Version 2 and due for submission prior to 1 October 2027.

The revised portfolio and all supporting materials are available on the [Stage 2](#) tab in the Resources area, under Portfolio & Matrices / Portfolio Information sections.
